2 pieces Canbus - Resistors - 12V/21W

A smart way to eliminate error messages, when converting to LED bulbs.

When switching the fog/tail lights with LED styling lamps or the diode bulbs, the power consumption will be lower than usual and thare can be therefore experienced error messages on some newer cars with Can-Bus or bulb-control. You will therefore need to apply these "cheat resistors", which raise the consumption, so that it matches a regular bulb. The resistors will be connected to the + and - approach from the car.

1 set of brake lights-resistors 21W suit 2 fog lights/daytime running lights/tail lights.
