Cheat-resistors for 12V, 5W

A smart way to remove errors when switching to LED position lights or to diode rear lights.

When switching from 5 Watt indicator, position or rear light bulbs to LED bulbs, the power consumption will be lower than normal. You might experience error messages on some newer cars with canbus or bulb-control. Because of this you will need to apply these "cheat resistors", which raises the consumption, so that it matches a regular bulb.

The resistors need to be connected to the + and the minus - to the socket/bulb.
