Cheat-resistors for 24V, 5W

Cheat Resistors to cheat the trucks bulb-control / check

When switching from 5W position light bulbs to LED ones, the power consumption will get lower than usual and therefore might be experienced error messages on some newer cars with bulb-control. Because of this you will have to apply these "cheat light bulbs", which raise the consumption, so that it matches a regular bulb. The resistors will be connected to the + and - approach to the socket/bulb.

The complete set consists of 2 resistors with wires, and 4 clamp shunts.
