Mini Driver for a High Power LEDs

An unprotected mini LED driver to provide a high power LED with the right amount of power.

An unprotected mini LED driver to provide a high power LED with the right amount of power.

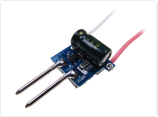

Selecting a driver is easy enough:

- A higher current (mA, mili-AMPS) gives more light. Do not exceed the maximum current for the diode!
- Do not exceed the number of diodes as indicated on the driver.

We recommend to supply these drivers with 12V DC from a transformer or directly from a car/mc wiring/battery.
