Serie 40 - Inside Bracket

An inside-bracket for joining two profiles in a 90 degree angle.

An inside-bracket for joining two profiles in a 90 degree angle.

The bracket is slided in to the first profile, where after you tighten it with the pinol screw. The end of the second profile is put over the bracket, and also tightened with a pinol-screw.

A very simple and angle-joint, that is also more or less hidden compared to larger brackets. As it is primarily the pinol-screw holding the joint, you should not use this for high loads, where we recommend standard brackets or end-joints.
