Mini sensor - Touchless, 12V-24V, 8A

Sensor that activates when motion is sensed. Turns on and off the output without touch, available with dimming

Sensor that activates when motion is sensed close by, which means it works like a motion sensor with short range. It Turns on and off the output without touch, e.g. a hand swipe close by.

The one model is with built-in dimmer, that dims up and down when you hold the hand in front of the sensor.

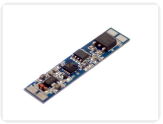

The sensor can be used for eg. LED strips in profiles behind fronts. It has a range of 10cm, so it might work less well behind very matte fronts.
