Serie 40 and 30 - Door catcher

Simple mechanism for holding doors and similar closed. The two small balls will clamp around the other part. A good pull unlocks it.

Simple mechanism for holding doors and similar closed. Made from glass-fibre reinforced nylon and stainless steel balls.

The part with the two metal-balls is typically mounted on the door, while the part with the the arms is mounted on the inside of the frame. When the lid is closed it will be stopped by the arms. The two balls will be clamped inside the arms, locking the door in the position. A easy pull will open the door again.

The door catcher is a great solution for lids, as it will ensure that the door locks perfectly in the frame.
